Lab 7: Fuzzing for Input Validation Bugs

Hypothesis Fuzz Testing Report & Verification Screenshots

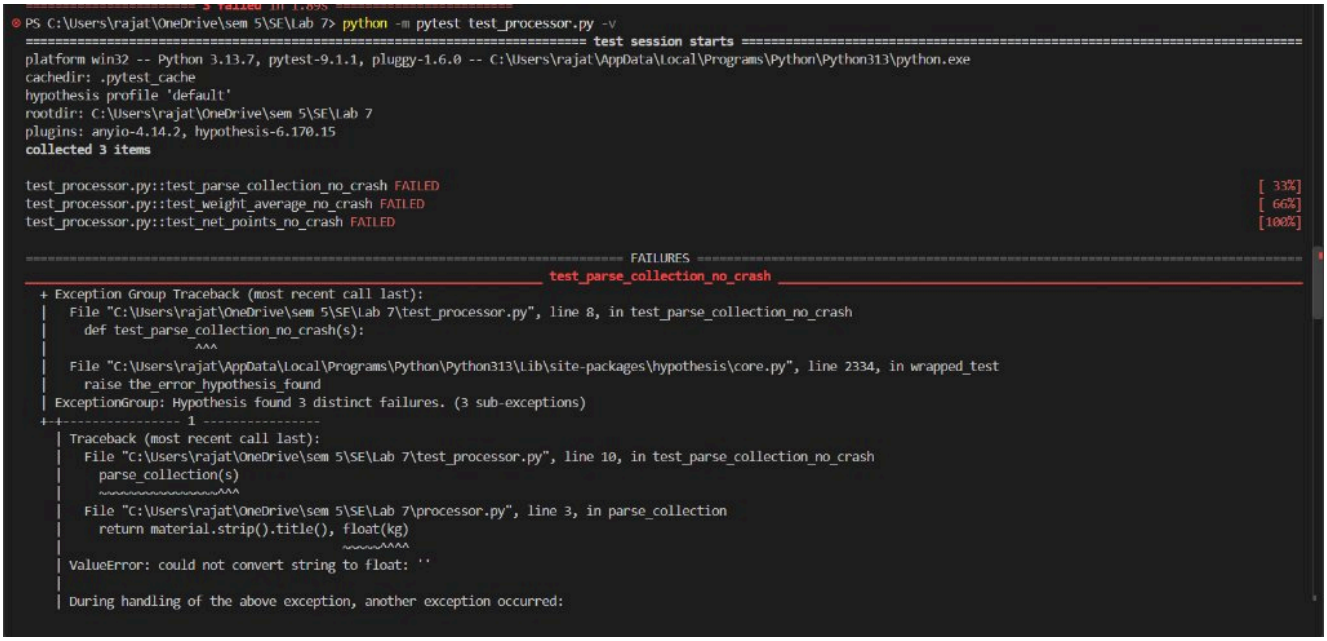

Step 2: Output of Buggy Application (processor.py)

Output when running the original buggy application with valid inputs.

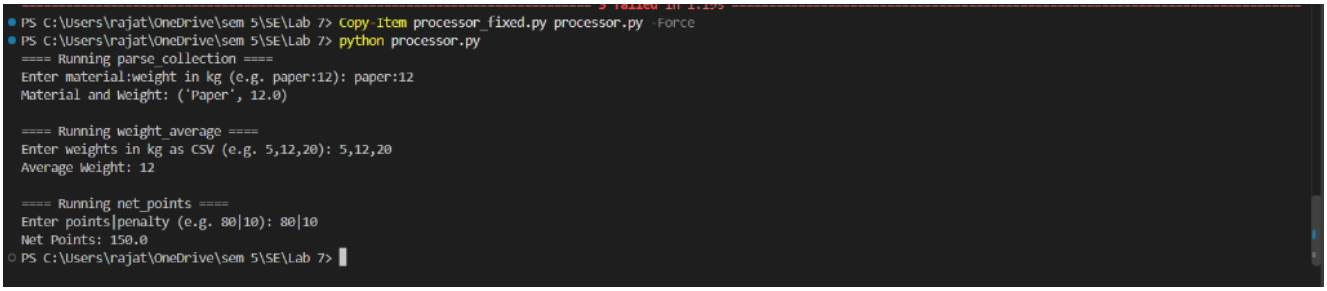

Step 4: Hypothesis Fuzz Test Failures (test_processor.py)

Hypothesis automatically generating malformed inputs and revealing unhandled exceptions/crashes across all 3 functions.

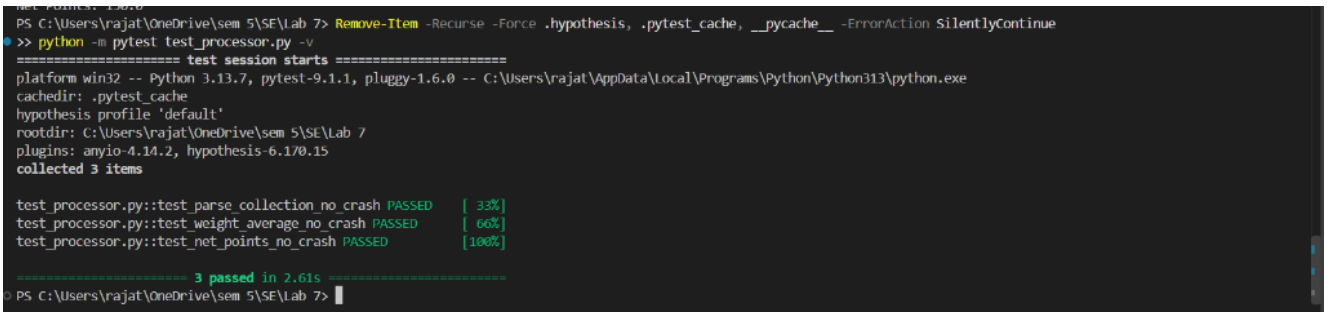

Step 5: Output of Fixed Application (processor.py)

Defensive checks implemented. Application executes cleanly on valid inputs.

Step 6: Hypothesis Fuzz Tests Passing

Re-running test_processor.py against the hardened application script. All 3 property tests pass cleanly.

Deliverables Summary:

1. PDF Document with terminal execution screenshots (This document)
2. Fixed application script: processor.py
3. Updated Hypothesis fuzz test suite: test_processor.py
